ABSTRACT OF THE DISCLOSURE

A preferred printing system includes a printer configured to communicatively couple with a workstation, which incorporates a first code entry device for receiving first coding information from a user. The printer incorporates a second code entry device that is configured to receive second coding information from the user. Additionally, the printer is configured to print data in response to correlating the first coding information received at the first code entry device with the second coding information received at the second code entry device. Devices, methods and computer readable media also are provided.
